NOTES : ON OUTRIGGERS

1. The rated lifting capacity chart indicates the maximum load which can be lifted by this crane provided it is level and standing on firm, level ground. It includes the mass of the hook and all other slings etc. The area of the rated lifting capacity chart surrounded by a thick black line is the area in which capacity is determined by the structural strength of the crane. Elsewhere the crane's stability is the deciding factor.
2. The working radius is based on the actual radius including boom deflection.
Always use the actual working radius as the standard criterion for crane operation.
3. The jib working radius is based on the jib mounted on the end of the 28.4m, 36.7m or 45.0m boom. If the boom is at any other length use the boom angle alone as the standard criterion for crane operation. (The jib is optional.)
4. Never operate the crane with the jib when outriggers are fully retracted or when outriggers are intermediately extended without counterweight. (The jib is optional.)
5. When outriggers are fully retracted, crane operation is allowed only for the configuration of counterweight up to 5ton with boom length up to 20.1m.
without counterweight : max. 20.1m boom
5t counterweight : max. 20.1m boom
6. The rated lifting capacity of the rooster sheave is the rated lifting capacity of the boom minus the mass of all attached slings etc. to the boom, with an upper limit of 6,500kg.
[The hook for use with the rooster sheave is the 6.5 ton hook (mass 150kg) with one part of line.]
7. When planning a lift using the rated lifting capacity chart, always work with the condition that gives the greatest safety factor.
8. If you are working with the boom while the jib is rigged subtract 3,500kg from the rated lifting capacity as well as subtracting the mass of the slings etc.
Do not use the rooster sheave in this situation. (The jib is optional.)
9. The over rear lifting capacity is applied only to the crane configuration when the superstructure is facing straight rear and the slewing lock is engaged.
10. Use the sub-top sheave and sub-hook sheave when operating the crane loading with more than 60ton.
11. In whatever working conditions the corresponding boom critical angle is shown in the table. Lowering the boom below the critical angle could cause the machine to tip over even if the crane is not carrying any added load.
12. The standard parts of line for each boom length are as shown in the table. If you work with a non-standard number of parts of line take 6,500kg as the maximum load on any part of the wire rope.
13. Crane operation is permissible up to a wind speed of 10m/s.
Even in relatively light wind conditions, extra care should be taken when handling loads presenting large wind catching areas.
14. Kato bears no liability whatsoever for damage, crane tipping or other accident caused by crane operations which differ from the directions contained in the instruction manual and the warning labels.

WORKING RANGE

Note: 1. This diagram does not include deflection of Boom and Jib.
 2. The outriggers are fully extended with a 15t counterweight in this diagram.
